

# Parametric Valid Inequalities in Discrete Optimization

<sup>1</sup>COR@L Lab, Department of Industrial and Systems Engineering, Lehigh University

## Parametric Valid Inequalities

- Developed parametric valid inequalities (PVI) based on **duality** and the **value functions** of **multilevel/multistage mixed integer linear optimization** problems
- Employed these inequalities in **two research works**

## Solving Multilevel/Multistage Mixed Integer Linear Optimization

### Motivation

Many real-world applications have:

- **Discrete/indivisible** decisions
- **Multiple** objectives
- **Multiple** decision-makers
- **Multiple** time periods

But hardly any research work addresses this **generic** class of problems

### Application Areas

- Airline pricing and capacity allocation
- Natural gas shipping
- Road network construction
- Toll revenue maximization
- Electricity demand management
- Chemical process optimization
- Gene-deletion strategy development
- Attacker-defender type problems
- **Many more...**

### Methodology

- Developed an abstract framework for generalizing **Benders' technique** for **reformulation** that encompasses non-traditional problem classes
- Specified an algorithmic procedure employing **PVIs**
- Applied this procedure to solve **mixed integer bilevel linear optimization** problems
- Implemented this algorithm in **MibS**, an open-source solver written in **C++**

## Warm-starting Mixed Integer Linear Optimization

### Motivation

Many applications require **re-solving** an optimization problem:

- **Thousands** of times per minute
- **Closely-related** problems with **minor** variation in the input data

But usually, these re-solves are done **independently** by discarding most of the **useful** historical information

### Application Areas

- | Online optimization   | Optimization problem classes   | Algorithms  |
|---|--|---|
| <ul style="list-style-type: none"><li>• Routing</li><li>• Stochastic matching</li><li>• Resource allocation</li></ul> | <ul style="list-style-type: none"><li>• Bilevel optimization</li><li>• Multi-criteria optimization</li><li>• Stochastic optimization</li></ul> | <ul style="list-style-type: none"><li>• Decomposition</li><li>• Lagrangian relaxation</li></ul> |

### Methodology

- **Solving** an optimization problem
- **Gathering** relevant information primarily based on the **theory of duality**
- **Reusing** above information for solving another problem by using **PVIs**
- Implementation in **SYMPHONY**, an open-source solver written in **C/C++**
